

Task 1: Course registration Form implementation

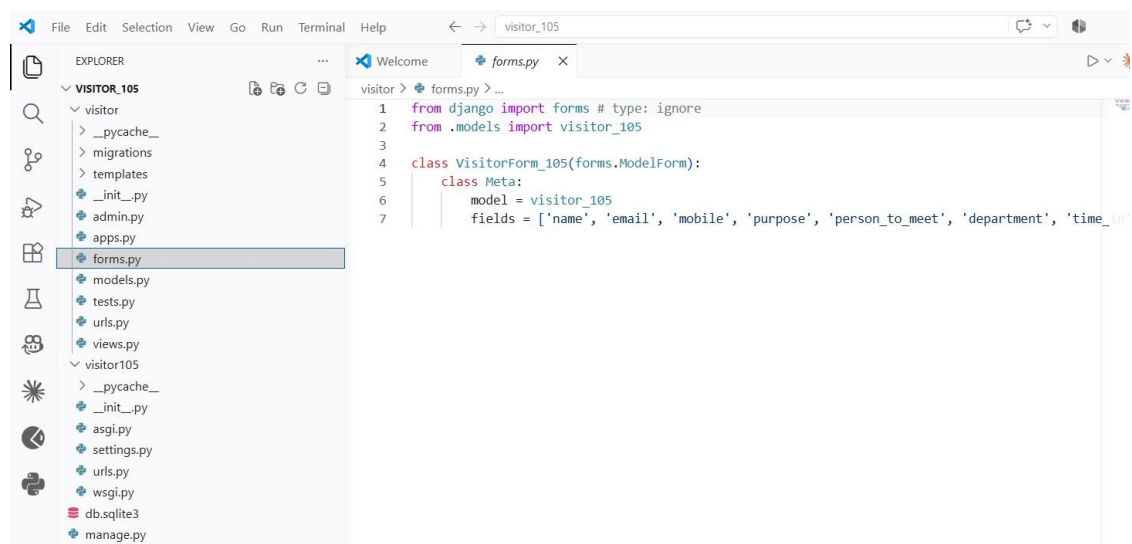

Models.py:

The screenshot shows the Visual Studio Code editor with the 'models.py' file open in the 'visitor105' app. The Explorer sidebar on the left shows the project structure, with 'models.py' selected under the 'visitor105' folder. The code in the editor defines a Django model named 'visitor_105' with the following fields:

```
1 from django.db import models # type: ignore
2
3 # Create your models here.
4 class visitor_105(models.Model):
5     name = models.CharField(max_length=100)
6     email = models.EmailField(unique=True)
7     mobile = models.CharField(max_length=15)
8     purpose = models.CharField(max_length=200)
9     person_to_meet = models.CharField(max_length=100)
10    department = models.CharField(max_length=100)
11    time_in = models.TimeField()
12    time_out = models.TimeField()
13    visit_date = models.DateField()
14
15    def __str__(self):
16        return self.name
```

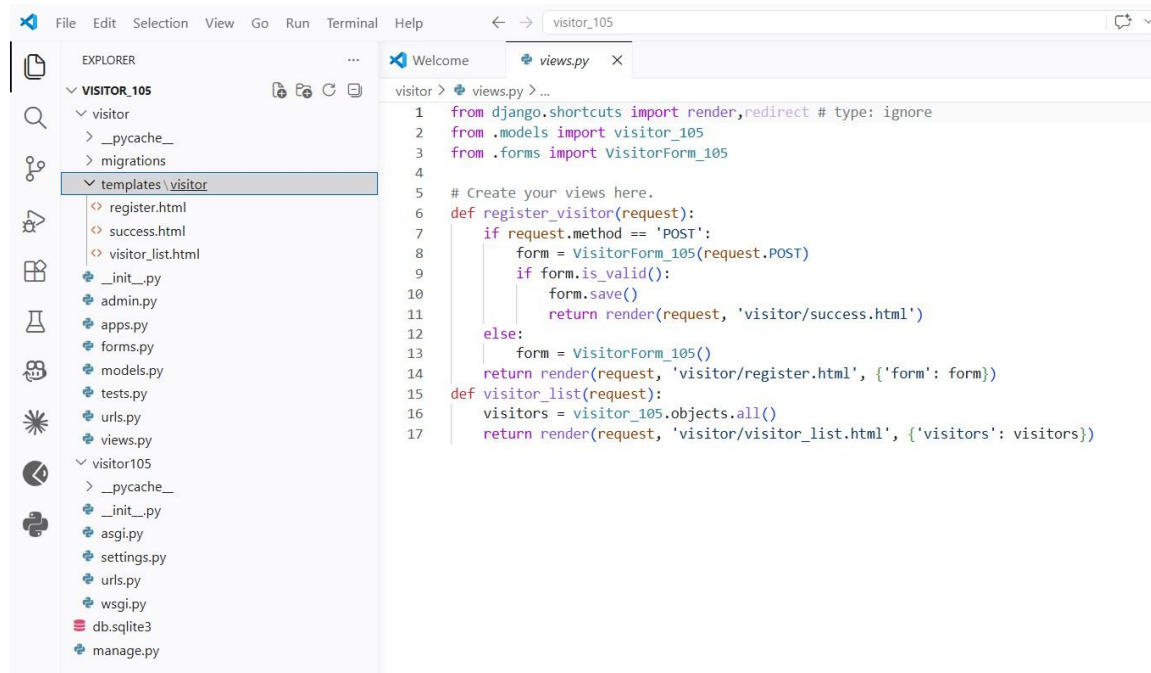

Forms.py:

The screenshot shows the Visual Studio Code editor with the 'forms.py' file open in the 'visitor105' app. The Explorer sidebar on the left shows the project structure, with 'forms.py' selected under the 'visitor105' folder. The code in the editor defines a Django form named 'VisitorForm_105' with the following fields:

```
1 from django import forms # type: ignore
2 from .models import visitor_105
3
4 class VisitorForm_105(forms.ModelForm):
5     class Meta:
6         model = visitor_105
7         fields = ['name', 'email', 'mobile', 'purpose', 'person_to_meet', 'department', 'time_in']
```

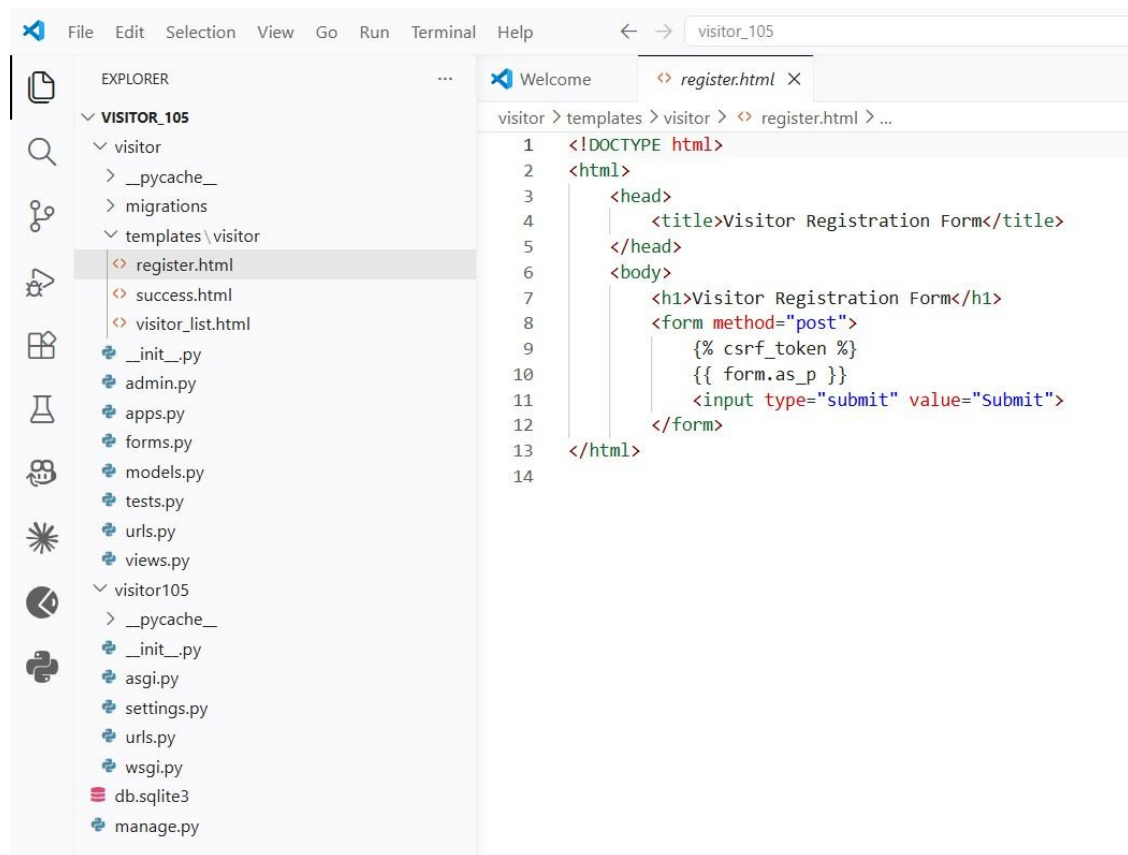

Views.py:

The screenshot shows the Visual Studio Code editor with a Django project named 'visitor_105'. The Explorer sidebar on the left shows the project structure, with 'templates/visitor' selected. The main editor window displays the 'views.py' file. The code defines two views: 'register_visitor' and 'visitor_list'. 'register_visitor' handles POST requests by creating a 'VisitorForm_105' instance, saving it, and rendering 'success.html'. 'visitor_list' retrieves all visitors and renders 'visitor_list.html'.

```
1 from django.shortcuts import render, redirect # type: ignore
2 from .models import visitor_105
3 from .forms import VisitorForm_105
4
5 # Create your views here.
6 def register_visitor(request):
7     if request.method == 'POST':
8         form = VisitorForm_105(request.POST)
9         if form.is_valid():
10             form.save()
11             return render(request, 'visitor/success.html')
12     else:
13         form = VisitorForm_105()
14         return render(request, 'visitor/register.html', {'form': form})
15 def visitor_list(request):
16     visitors = visitor_105.objects.all()
17     return render(request, 'visitor/visitor_list.html', {'visitors': visitors})
```

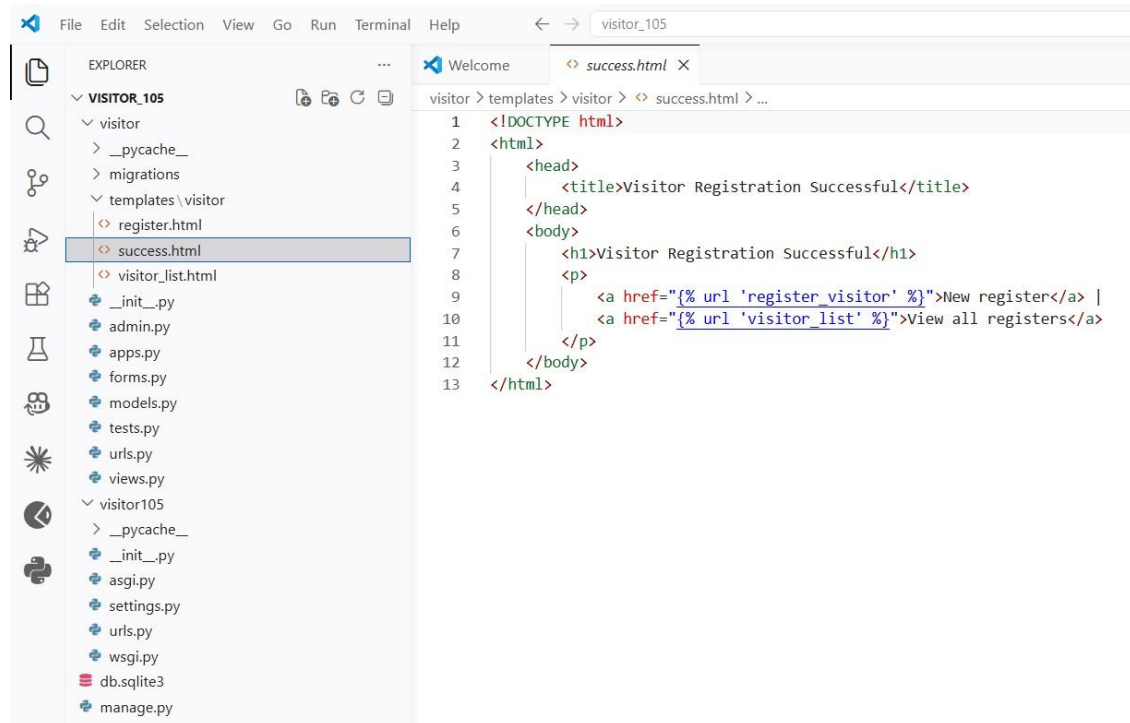

Add_visitor.html:

The screenshot shows the Visual Studio Code editor with the same Django project. The Explorer sidebar shows 'templates/visitor/register.html' selected. The main editor window displays the HTML template. It includes a title 'Visitor Registration Form' and a form with a CSRF token and a submit button.

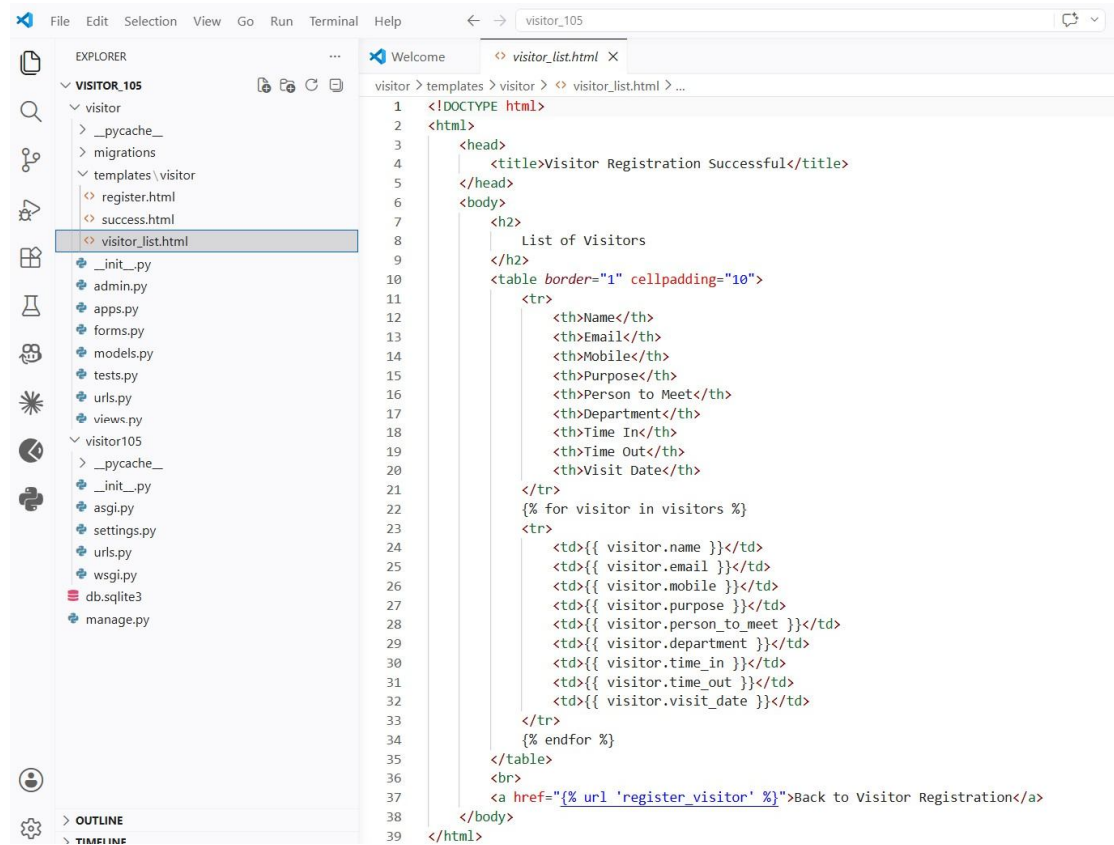

```
1 <!DOCTYPE html>
2 <html>
3     <head>
4         <title>Visitor Registration Form</title>
5     </head>
6     <body>
7         <h1>Visitor Registration Form</h1>
8         <form method="post">
9             {% csrf_token %}
10             {{ form.as_p }}
11             <input type="submit" value="Submit">
12         </form>
13     </html>
14
```

Success.html:

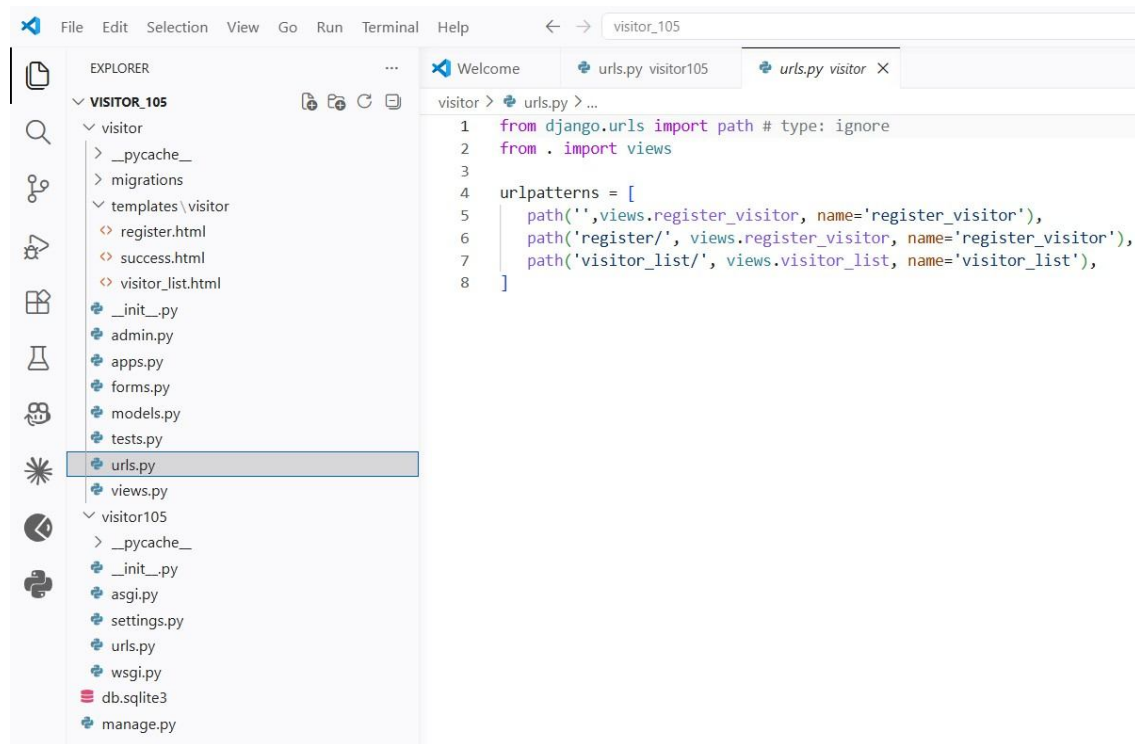

```
1 <!DOCTYPE html>
2 <html>
3   <head>
4     <title>Visitor Registration Successful</title>
5   </head>
6   <body>
7     <h1>Visitor Registration Successful</h1>
8     <p>
9       <a href="{% url 'register_visitor' %}">New register</a> |
10      <a href="{% url 'visitor_list' %}">View all registers</a>
11    </p>
12  </body>
13 </html>
```

Visitor_list.html:

```
1 <!DOCTYPE html>
2 <html>
3   <head>
4     <title>Visitor Registration Successful</title>
5   </head>
6   <body>
7     <h2>
8       List of Visitors
9     </h2>
10    <table border="1" cellpadding="10">
11      <tr>
12        <th>Name</th>
13        <th>Email</th>
14        <th>Mobile</th>
15        <th>Purpose</th>
16        <th>Person to Meet</th>
17        <th>Department</th>
18        <th>Time In</th>
19        <th>Time Out</th>
20        <th>Visit Date</th>
21      </tr>
22      {% for visitor in visitors %}
23      <tr>
24        <td>{{ visitor.name }}</td>
25        <td>{{ visitor.email }}</td>
26        <td>{{ visitor.mobile }}</td>
27        <td>{{ visitor.purpose }}</td>
28        <td>{{ visitor.person_to_meet }}</td>
29        <td>{{ visitor.department }}</td>
30        <td>{{ visitor.time_in }}</td>
31        <td>{{ visitor.time_out }}</td>
32        <td>{{ visitor.visit_date }}</td>
33      </tr>
34      {% endfor %}
35    </table>
36    <br>
37    <a href="{% url 'register_visitor' %}">Back to Visitor Registration</a>
38  </body>
39 </html>
```

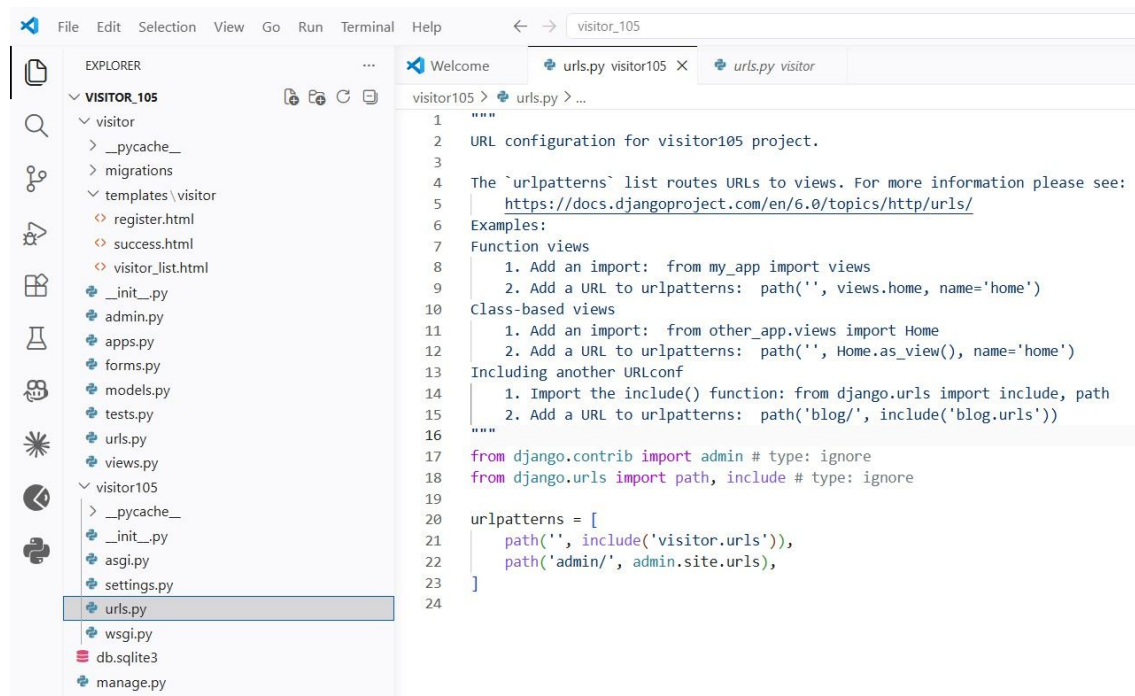

Visitorapp/urls.py:

The screenshot shows the Visual Studio Code editor with the Explorer sidebar on the left and the Editor window on the right. The Explorer sidebar shows the project structure for 'VISITOR_105', with 'urls.py' selected under the 'visitor' directory. The Editor window displays the content of 'urls.py'.

```
1 from django.urls import path # type: ignore
2 from . import views
3
4 urlpatterns = [
5     path('', views.register_visitor, name='register_visitor'),
6     path('register/', views.register_visitor, name='register_visitor'),
7     path('visitor_list/', views.visitor_list, name='visitor_list'),
8 ]
```

Visitor/urls.py:

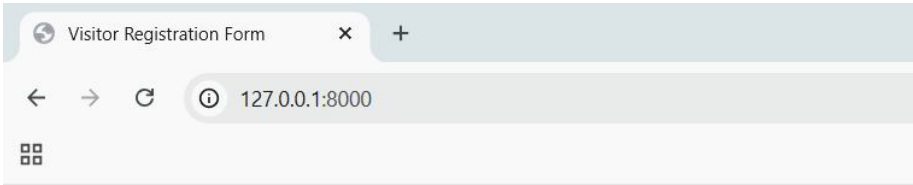

The screenshot shows the Visual Studio Code editor with the Explorer sidebar on the left and the Editor window on the right. The Explorer sidebar shows the project structure for 'VISITOR_105', with 'urls.py' selected under the 'visitor105' directory. The Editor window displays the content of 'urls.py'.

```
1 """
2 URL configuration for visitor105 project.
3
4 The `urlpatterns` list routes URLs to views. For more information please see:
5     https://docs.djangoproject.com/en/6.0/topics/http/urls/
6 Examples:
7 Function views
8     1. Add an import: from my_app import views
9     2. Add a URL to urlpatterns: path('', views.home, name='home')
10 Class-based views
11     1. Add an import: from other_app.views import Home
12     2. Add a URL to urlpatterns: path('', Home.as_view(), name='home')
13 Including another URLconf
14     1. Import the include() function: from django.urls import include, path
15     2. Add a URL to urlpatterns: path('blog/', include('blog.urls'))
16 """
17 from django.contrib import admin # type: ignore
18 from django.urls import path, include # type: ignore
19
20 urlpatterns = [
21     path('', include('visitor.urls')),
22     path('admin/', admin.site.urls),
23 ]
24
```
